

RECORD SYSTEM

Abstract

A system and process for providing a computerized medical and biographical records database and diagnostic information. A medical records database and diagnostic program is stored on a central computer that is accessible to individuals using remotely situated computers connected to a computer network. Individual patient medical and biographical records are owned by individual patients who can enter information in their record as well as grant or deny authorization to others, such as health care professionals, insurance providers and other entities, to review part or all of their record. The method, process and system establishes the parameters of function of providers and users of the services, stores all available data, provides the functional platforms for all medical, non-medical, and financial transactions to occur in an electronic, software-guided, anonymous, efficient, and uniform environment.
